

Ctek maintains a list server style newsgroup for developers and system integrators using Ctek's Linux based products including the ARM powered products as well as the older Axis ETRAX based SkyRouters. A list server is an interactive forum implemented with email. Web access is also available but most will find it convenient to follow and respond to the group using their email client. Ctek uses the newsgroup to communicate the release of new or updated documents, hardware and firmware updates, and to answer technical questions.

Please send questions on technical matters regarding development using Ctek products to this list. It is monitored by Ctek personnel who will try to answer as many questions as possible. We also anticipate that our knowledgeable user community will in many cases have posted the answer before we see the question. That's what development list servers are all about. To subscribe to the list using email send a blank email to [subscribe](#) using the email address that you wish to receive group messages on. You will receive an acknowledgement email that must be responded to. Posting or replying to the group is as easy as sending an email to [post](#).

For those wishing to have web access subscription is available at [web-subscribe](#) and the list may be viewed and responded to at [web-post](#).
